Before the discovery of insulin, a diagnosis of Type 1 diabetes was a death sentence. To mark the centenary of this landmark in medicine, this book charts the journey of how insulin was transformed from what one clinician called 'thick brown muck' into the very first drug to be produced using genetic engineering, and which earned the founders of US biotech company Genentech a small fortune. Taking the reader on a fascinating journey, starting with the discovery of insulin in the 1920s through to the present day, *Insulin - The Crooked Timber* reveals a story of monstrous egos, toxic career rivalries, and a few unsung heroes and heroines. It discusses in detail the circumstances of Canadian scientist Frederick Banting whose award of the 1923 Nobel Prize for this life-saving discovery proved to be both a blessing and a curse for him and explores how the human story behind this discovery still remains one of ongoing political and scientific controversy. The book is the result of the author's own shocking diagnosis with Type 1 diabetes and its story reminds us all of what technology can - and cannot do - for us. As the world struggles to emerge from the COVID-19 pandemic and face future challenges such as climate change, the lessons that we can learn from the story of insulin have never been more important.

It offers entirely new material, reflecting recent advances in the field, covering the latest research, experimental approaches, and measurement methodologies. This sixth edition treats such foundational topics as memory, attention, and language, as well as other areas, including computational models of cognition, reward and decision making, social neuroscience, scientific ethics, and methods advances. Over the last twenty-five years, the cognitive neurosciences have seen the development of sophisticated tools and methods, including computational approaches

that generate enormous data sets. This volume deploys these exciting new instruments but also emphasizes the value of theory, behavior, observation, and other time-tested scientific habits. For the first time four workshops have been held in conjunction with the 8th Object-Oriented Information Systems conference, OOIS 2002, to encourage interaction between researchers and practitioners. Workshop topics are, of course, inline with the conference's scientific scope and provide a forum for groups of researchers and practitioners to meet together more closely and to exchange opinions and advanced ideas, and to share preliminary results on focused issues in an atmosphere that fosters interaction and problem solving. The conference hosted four one-day workshops. The four selected workshops were fully in the spirit of a workshop session hosted by a main conference. Indeed, OOIS deals with all the topics related to the use of object-oriented techniques for the development of information systems. The four workshops are very specific and contribute to enlarging the spectrum of the more general topics treated in the main conference. The first workshop fo-

cused on a very specific and key concept of object-oriented development, the specialization/generalization hierarchy. The second one explored the use of "non-traditional" approaches (at the edge of object-oriented techniques, such as aspects, AI, etc.) to improve reuse. The third workshop dealt with optimization in Web-based information systems. And finally the fourth workshop investigated issues related to model-driven software development.
