33kV to 11kV transformers steps down the the voltage to a safe level, which is then distributed via 11kV feeders to homes and businesses. Many people question why the voltage is as high as 33kV in the first place. The reason is that the higher the transmission voltage, the lower the transmission losses will be. Therefore, the longer the distances that the power needs to be transferred, a higher voltage is used to reduce the transmission losses.

It acts as connecting link between generating Station and consumers. Power transformers are being used to change voltage level at substation. 33/11 kv Subtation is used to step down voltage from 33 kv to 11kv and the output is connected to feeder for local utility. The primary voltage for power transformer at 33/11kv substation is 33 kv which is fed from secondary transmission line.
