BEGINNING AND INTERMEDIATE ALGEBRA: CONNECTING CONCEPTS THROUGH APPLICATIONS, shows students how to apply traditional mathematical skills in real-world contexts. The emphasis on skill building and applications engages students as they master algebraic concepts, problem solving, and communication skills. Students develop sound mathematical skills by learning how to solve problems generated from realistic applications, instead of learning techniques without conceptual understanding. Authors Mark Clark and Cynthia Anfinson have developed several key ideas to make concepts real and vivid for students. First, the authors place an emphasis on developing strong algebra skills that support the applications, enhancing student comprehension and developing their problem solving abilities. Second, applications are integrated throughout, drawing on realistic and numerically appropriate data to show students how to apply math and to understand why they need to know it. These applications require students to think critically and develop the skills needed to explain and think about the meaning of their answers. Third, important concepts are developed as students progress through the course and overlapping elementary and intermediate content is kept to a minimum. Chapter 8 sets the stage for the intermediate material where students explore the eyeball best-fit approach to modeling and understand the importance of graphs and graphing including graphing by hand. Fourth, Mark and Cynthia's approach prepares students for a range of courses including college algebra and statistics. In short, *BEGINNING AND INTERMEDIATE ALGEBRA: CONNECTING CONCEPTS THROUGH APPLICATIONS* develops strong mathematical skills using an engaging, application-driven and problem solving-focused approach to algebra. This calendar is meant to review mathematics concepts from basic to complex. Each page is dedicated to two days of the year and each day starts with a meaningful quotation from the public domain, followed by four math problems. The first two are from developmental math, basic through intermediate algebra (up to high school algebra II), and the last two are from college credit mathematics, college algebra through calculus I. The level of difficulty is naturally increasing throughout the year, so one can review (or learn) a majority of undergraduate math concepts in 365 days over a set of 1,460 problems. Consequently, people interested in the developmental mathematics should focus on the first two daily problems, while those more advanced should focus on problems #3 and #4. The main point of this daily mathematical setup is that the answers to the four problems are always found in the date, in this order: the month's number, the day's number, 20, and the number formed by the last two digits of the year (example: 2-14-20-15). Another feature is that in most cases there are several consecutive problems reviewing the same concept for extra practice. For a complete benefit, each problem should be solved in its entirety, the final answer being the numerical answer to the last or sometimes the main question. At times one might need to review the respective math concepts before attempting to solve. However, as the calendar is also meant to improve number sense (skill on the verge of extinction in modern education), hand-held calculators and computer software should be used minimally. A second use of the calendar can be as a personal day planner. One could write notes and appointments in the space available on each page. And a third consideration should be given to the collection of problems itself. Since this set is reviewing basically the entire undergraduate mathematics curriculum, it is perennial. One could find meaningful practice problems in this book for years to come. Moreover, I will update the problem set for new editions of the calendar and I will make it available year after year beyond 2015.

Provides subject reviews for each section, six full-length practice tests with explanatory answers, and test-taking strategies to improve TACHS, COOP, and HSPT scores.

Barnett, Ziegler, Byleen, and Sobecki's *College Algebra with Trigonometry* text is designed to be user friendly and to maximize student comprehension by emphasizing computational skills, ideas, and problem solving as opposed to mathematical theory. The large number of pedagogical devices employed in this text will guide a student through the course. Integrated throughout the text, students and instructors will find Explore-Discuss boxes

which encourage students to think critically about mathematical concepts. In each section, the worked examples are followed by matched problems that reinforce the concept being taught. In addition, the text contains an abundance of exercises and applications that will convince students that math is useful. A MathZone site featuring algorithmic exercises, videos, and other resources accompanies the text.

Algebra: Form and Function was designed based on the fundamental goal for a student to foster understanding of algebraic structure- that is, an understanding of how the arrangements of

symbols allows us to predict, for example, the behavior of a function or the number of solutions to an equation. Mastering algebraic structure enables students to read algebraic expressions and equations in real-life contexts, not just manipulate them, and to choose which form or which operation will best suit the context. It facilitates being able to translate back and forth between symbolic, graphical, numerical, and verbal representations. By balancing practice in manipulation and opportunities to see the big picture, Algebra: Form and Function offers a way for teachers to help students achieve real mastery of algebra.
