M. WILKINSON Patients with frequent or daily headaches pose a very difficult problem for the physician who has to treat them, particularly as many patients think that there should be a medicine or medicines which give them instant relief. In the search for the compound which would meet this very natural desire, many drugs have been manufactured and the temptation for the physician is either to increase the dose of a drug which seems to be, at any rate, partially effective, or to add one or more drugs to those which the patient is already taking. Although there have been some references to the dangers of overdose of drugs for migraine in the past, it was not until relatively recently that it was recognized that drugs given for the relief of headache, if taken injudiciously, may themselves cause

headache. The first drugs to be implicated in this way were ergotamine and phenazone. In the case of ergotamine tartrate, the dangers of ergotism were well known as this was a disorder which had been known and written about for many years. In the treatment of headache, fully blown ergotism is rare and in recent years has usually been due to self-medication in doses much greater than those prescribed although there are a few recorded cases where toxic amounts have been given.

Review Guides/Certification Prep/Pocket Guides Nonsuicidal self-injury (NSSI) is a baffling, troubling, and hard to treat phenomenon that has increased markedly in recent years. Key issues in diagnosing and treating NSSI adequately include differentiating it from attempted suicide and other mental dis-

orders, as well as understanding the motivations for self-injury and the context in which it occurs. This accessible and practical book provides therapists and students with a clear understanding of these key issues, as well as of suitable assessment techniques. It then goes on to delineate research-informed treatment approaches for NSSI, with an emphasis on functional assessment, emotion regulation, and problem solving, including motivational interviewing, interpersonal skills, CBT, DBT, behavioral management strategies, delay behaviors, exercise, family therapy, risk management, and medication, as well as how to successfully combine methods.

This report considers the biological and behavioral mechanisms that may underlie the pathogenicity of tobacco smoke. Many Surgeon General's reports have considered research findings on mechanisms

in assessing the biological plausibility of associations observed in epidemiologic studies. Mechanisms of disease are important because they may provide plausibility, which is one of the guideline criteria for assessing evidence on causation. This report specifically reviews the evidence on the potential mechanisms by which

smoking causes diseases and considers whether a mechanism is likely to be operative in the production of human disease by tobacco smoke. This evidence is relevant to understanding how smoking causes disease, to identifying those who may be particularly susceptible, and to assessing the potential risks of tobacco products.
