In addition, closely related areas such as diabetes, diabetic eye disease and macrovascular involvement in diabetes are addressed. Diabetic Nephropathy will be of interest for nephrologists, diabetologists, internists, transplant physicians, public health professionals, basic scientists, geneticists, epidemiologists, pathologists, and molecular and cell biologists working in the field of diabetes and its complications.

Devoted to the epidemiology, phenomenology, psychobiology, treatment and consequences of late-life depression. Although much has been written about depressive disorders, the focus has been primarily on the illness as experienced in younger adults. The effects of aging on the brain, the physiological and behavioral consequences of recurrent depression, and the impact of other diseases common in the elderly, make late-life depression a distinct entity. There is a compelling need for a separate research program, specialized treatments, and a book dedicated to this disorder.

Our understanding of the pathogenesis of renal diseases and the ability to accurately classify and diagnose them has improved considerably over the last two decades. Until now, however, this information has not been available in a single, up-to-date and succinct yet comprehensive source. The publication at hand aims at filling this gap, condensing a vast amount of information into easily accessible chapters. After a discussion of basic concepts and principles of renal tissue reactions to injurious agents using a specific cell/compartments approach, a multitude of disorders are looked at, including renal interstitial fibrosis, glomerulosclerosis, various forms of glomerulonephritis and nephropathy, amyloidosis and renal Fanconi syndrome. Some of the chapters address controversial subjects, reporting the current situation and showing areas of future potential research interest. At the end of many of the contributions, a summary is provided, often in the form of a chart to facilitate the understanding of the information and to make it most useful for didactic purposes. This book is intended for students of various disciplines, as well as clinicians and investigators and all those trying to correlate basic research information with clinical issues.

The aim of this volume is to review the state-of-the-art in analytical voltammetry with regard to theory and instrumentation, and show how these relate to the analysis of inorganic, organometallic, organic and biological molecules. Modern voltammetric techniques have practical applications in biological, pharmaceutical and environmental chemistry. The growing importance of voltammetry in the development of modified electrodes and biological electrodes and chemical and biological sensors is also highlighted.

This important collection of more than twenty original essays by prominent Kant scholars covers the multiple aspects of Kant's teaching in relation to his published works. With the Academy edition's continuing publication of Kant's lectures, the role of his lecturing activity has been drawing more and more deserved attention. Several of Kant's lectures on metaphysics, logic, ethics, an-

thropology, theology, and pedagogy have been translated into English, and important studies have appeared in many languages. But why study the lectures? When they are read in light of Kant's published writings, the lectures offer a new perspective of Kant's philosophical development, clarify points in the published texts, consider topics there unexamined, and depict the intellectual background in richer detail. And the lectures are often more accessible to readers than the published works. This book discusses all areas of Kant's lecturing activity. Some essays even analyze in detail the content of Kant's courses and the role of textbooks written by key authors such as Baumgarten, helping us understand Kant's thought in its intellectual and historical contexts. Contributors: Huaping Lu-Adler; Henny Blomme; Robert Clewis; Alix Cohen; Corey Dyck; Faustino Fabbianelli; Norbert Fischer; Courtney Fugate; Paul Guyer; Robert Louden; Antonio Moretto; Steve Naragon; Christian Onof; Stephen Palmquist; Riccardo Pozzo; Frederick Rauscher; Dennis Schulting; Oliver Sensen; Susan Shell; Werner Stark; John Zammito; Günter Zöller

#### Publisher Description

This book discusses unique ion channels and transporters that are located within epithelial tissues of various organs including the kidney, intestine, pancreas and respiratory tract. The authors will show, that each of these channels and transporters play crucial roles in transepithelial ion and fluid transport across epithelia and their responsibility in maintaining homeostasis. The reader gains an understanding of the fundamentals of epithelial ion transport, in terms of function, modelling, regulation, trafficking, structure and pharmacology. This is the third of three volumes highlighting the importance of epithelial ion channels and transporters in basic physiology and pathophysiology of human diseases. The focus of this volume lies with different ion channel and transporter families. Additionally, this volume benefits from pharmaceutical contributors and their insights into recent pre-clinical drug discovery efforts and results from clinical trials. Overall, these chapters offer a more thorough coverage of individual epithelial ion channels and transporters from the 1st Edition, along with eleven new chapters. That makes Volume 3 an insightful contribution for physiology students, scientists and clinicians.

Personal in approach, beautiful in design, global in scope, *The Peripatetic Pursuit of Parkinson Disease* envisions a better world for people with Parkinson disease (PD). Developed by the Parkinsons Creative Collective (all of whom have PD), it is an anthology of the experiences of over 120 experts at living with PD -- the patients themselves. Join them on a journey from diagnosis, to informed patient, to empowered advocate. Filled with information and inspiration, it's a color-illustrated encyclopedia of PD from the patients' point of view. With nearly one quarter of the voices from around the world, it encourages discussion while it speaks to those newly diagnosed as well as to those who have lived with PD for years. Even medical professionals reading the book have found new perspectives on what it is like to live with PD. It delivers much more than the basics about this chronic, progressive, neurological disease. The authors share their stories and strategies on how to improve health, quality of life, and wellness in spite of PD. They also present opinions on how to speed the development of new treatments and how to face other life challenges that come with PD. --For those with PD, it's a support group between two covers; and for everyone else, it's a window into the world of PD.

Are humans at their core seekers of their own pleasure or cooperative members of society? Paradoxically, they are both. Pleasure-seeking can take place only within the context of what works within a defined community, and central to any community are the evolved codes and principles guiding appropriate behavior, or

morality. The complex interaction of morality and self-interest is at the heart of Geoffrey M. Hodgson's approach to evolutionary economics, which is designed to bring about a better understanding of human behavior. In *From Pleasure Machines to Moral Communities*, Hodgson casts a critical eye on neoclassical individualism, its foundations and flaws, and turns to recent insights from research on the evolutionary bases of human behavior. He focuses his attention on the evolution of morality, its meaning, why it came about, and how it influences human attitudes and behavior. This more nuanced understanding sets the stage for a fascinating investigation of its implications on a range of pressing issues drawn from diverse environments, including the business world and crucial policy realms like health care and ecology. This book provides a valuable complement to Hodgson's earlier work with Thorbjørn Knudsen on evolutionary economics in *Darwin's Conjecture*, extending the evolutionary outlook to include moral and policy-related issues.

In this revised and updated 1993 edition the authors synthesize recent research to provide a comprehensive survey of Mesoamerica.

"Abstract: In more than 150 years of research in the waters surrounding the Azores, several publications on the fauna of echinoderms of the archipelago have been produced, in the form of papers, notes, reports, reviews, and monographs. This work attempts to summarize the present knowledge on this marine group in the Azorean exclusive economic zone (i.e., waters within 200 nautical miles of the archipelago's shores). A short review of the history of the species' taxonomy is given, with key references, geographical distribution, ecology, additional notes and, when possible, figures. We herein report 172 species of echinoderms (6 crinoids, 55 ophiuroids, 45 asteroids, 36 holothurians, and 30 echinoids) from the Azores Archipelago, most of them inhabiting deep waters (>200 m). Only 29 shallow-water species were recorded locally ( $\leq 50$  m depth). In general, the echinoderm species present in the Azores are characterized by a wide geographical distribution in the Atlantic Ocean. Only nine taxa (all deep-water species, >840 m) appear to be restricted to the Azorean waters. Overall, the knowledge of the echinoderm fauna of the Azores is out-dated, with many species last collected in the archipelago over 100 years ago. A recent interest in the Azorean Mid-Atlantic waters has brought oceanographic cruises back to the archipelago, thus providing new opportunities for the renewal of 150 years of echinoderm studies in the area. Keywords: Echinodermata"--Page 3.

This book, which presents a cognitive-semiotic theory of cultural evolution, including that taking place in historical time, analyses various cognitive-semiotic artefacts and abilities. It claims that what makes human beings human is fundamentally the semiotic and cultural skills by means of which they endow their Lifeworld with meaning. The properties that have made human beings special among animals living in the terrestrial biosphere do not derive entirely from their biological-genetic evolution, but also stem from their interaction with the environment, in its culturally interpreted form, the Lifeworld. This, in turn, becomes possible thanks to the human ability to learn from other thinking beings, and to transfer experiences, knowledge, meaning, and perspectives to new generations.

A collection of essays by an international team of scholars, *Archival Afterlives* explores the posthumous fortunes of scientific and medical archives in early modern Britain. It demonstrates the sustaining importance of archival institutions in the growth of the "New Sciences."

Student Unit Guides are perfect for revision. Each guide is written by an examiner and explains the unit requirements, summarises the relevant unit content and includes a series of specimen questions and answers. There are three sections to each guide: Introduction - includes advice on how to use the guide, an explanation of the skills being tested by the assessment objectives, an outline of the unit or module and, depending on the unit, suggestions for how to revise effectively and prepare for the examination questions. Content Guidance - provides an examiner's overview of the module's key terms and concepts and identifies opportunities to exhibit the skills required by the unit. It is designed to help students to structure their revision and make them aware of the concepts they need to understand the exam and how they might analyse and evaluate topics. Question and Answers - sample questions and with graded answers which have been carefully written to reflect the style of the unit. All responses are accompanied by commentaries which highlight their respective strengths and weaknesses, giving students an insight into the mind of the examiner.

Cyber-crime increasingly impacts both the online and offline world, and targeted attacks play a significant role in disrupting services in both. Targeted attacks are those that are aimed at a particular individual, group, or type of site or service. Unlike worms and viruses that usually attack indiscriminately, targeted attacks involve intelligence-gathering and planning to a degree that drastically changes its profile. Individuals, corporations, and even governments are facing new threats from targeted attacks. *Targeted Cyber Attacks* examines real-world examples of directed attacks and provides insight into what techniques and resources are used to stage these attacks so that you can counter them more effectively. A well-structured introduction into the

world of targeted cyber-attacks Includes analysis of real-world attacks Written by cyber-security researchers and experts

Based on years of field work and the examination of thousands of museum specimens, *The Lizards, Crocodiles, and Turtles of Honduras* is the final installment of a series of volumes by James R. McCranie documenting the amphibians and reptiles of Honduras. Thoroughly illustrated by color photographs and maps of geographic distribution, the book describes in detail 86 species of Honduran lizards, crocodilians, and turtles. Identification keys in both English and Spanish allow the ready identification of all species, and discussions of conservation status review current threats to all species. The publication of this work represents the completion of the most comprehensive and detailed study of the amphibian and reptilian faunas of any country in Latin America.

This book discusses our intimate relationship with and dependence on water, how the body regulates its water levels, and various pathophysiological states associated with impairments in body water homeostasis. The human body consists of 70–80% water. Therefore, concise control of water homeostasis is essential to survival and involves coordination of several systems, but primarily the brain and kidney systems. Water requirements of the average healthy human range between 2–4 L/d, and a major portion of this can come from food sources. The major hormonal regulator of water balance is the anti-diuretic hormone, vasopressin. Vasopressin, a 9-amino acid peptide, is produced in the hypothalamus, stored in the posterior pituitary, and secreted when plasma osmolality rises. Vasopressin acts on the kidney to conserve water. The kidneys filter ~180 L of blood per day, consisting of about 50–65% water, and reabsorb around 99% of this in the proximal tubule, distal tubule, and collecting duct, producing only 1–2 L of urine. The vasopressin-sensitive distal tubule and collecting duct are responsible for fine-tuning water reabsorption. Conditions exist, however, where urine cannot be concentrated effectively. This is known as diabetes insipidus and can lead to dehydration and failure to thrive. At the other extreme, hyponatremia (low serum sodium) is the inability to adequately dilute urine or get rid of free body water in excess of body needs, a serious and sometimes fatal condition.

Development of moisturizers is a scientific and artistic discipline, where consumer insights are also needed. This new book bridges the gap between the moisturizers and the skin by covering all the essential information required to tailor the use of moisturizers to particular disorders and patients. Important aspects of skin biochemistry and barrier function are explained, and the ingredients and treatment effects of moisturizers are explored in depth. Careful attention is paid to controversies, including the role of certain moisturizers in inducing dryness/eczema, asthma, and comedones. The information provided in this unique book will enable the reader to go beyond the traditional thinking regarding skin care. The novel insights offered will suggest the properties required for a new generation of moisturizing treatments that more effectively improve the quality of life.

This volume explores numerous techniques for the genetic, molecular, biochemical, and structural examination of BCL-2 family proteins and their interactions. nance, cryo-electron microscopy, fluorescence microscopy and electron paramagnetic resonance. Written in the highly successful *Methods in Molecular Biology* series format, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step-by-step, readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Cutting-edge and thorough, *BCL-2 Family Proteins: Methods and Protocols* is a valuable resource to inspire and encourage novice and established scientists to further their research and make new discoveries in this exciting field.

Current von Neumann style computing is energy inefficient and bandwidth limited as information is physically shuttled via electrons between processor, short term non-volatile memory, and long-term storage. Biologically inspired neuromorphic computing, with its inherent autonomous learning capabilities and much lower power requirements based on analog processing, is seen as an avenue for overcoming these limitations. The development of nanoelectronic memory resistors, or memristors, is essential to neuromorphic architectures as they allow logic-based elements for information processing to be combined directly with nonvolatile memory for efficient emulation of neurons and synapses found in the brain. Memristors are typically composed of a switchable material with nonlinear hysteretic behavior sandwiched between two conducting encoding elements. The design, dynamic control, scaling and fundamental understanding of these materials is essential for establishing memristive devices. To explore the state-of-the-art in the materials fundamentally underlying memristor technologies: their science, their mechanisms and their functional imperatives to realize neuromorphic computing machines, the National Academies of Sciences, Engineering, and Medicine's Board on Physics and Astronomy convened a workshop on February 28, 2020. This publication summarizes the presentation and discussion of the workshop.

This publication provides a synopsis of the rapid progress made in the field of renal cell biology during the last decade, progress which has resulted in a better conceptual understanding of the cellular and molecular mechanisms of fibrotic renal disease. These developments have provided new therapeutic choices and led to the discovery of gene-based therapeutic options. The topics covered in this book have been carefully selected from the immense number of aspects of the disease to provide essential information on the molecular basis of renal fibrosis. Individual chapters discuss topics such as proteinuria and tubulointerstitial

injury, the roles and regulation of TGF-beta, chemokines, oxidant stress, matrix remodeling, significance of renal expression of NF-kappa, and the potential impact of cell death in renal fibrosis. Written so as to present the complex information as simply as possible, this publication will be a very useful tool for general health professionals involved in the fields of immunology and cell biology, as well as for clinicians and researchers within the fields of nephrology, pathology and matrix biology.

Recent advances in science have provoked debate about where cloning will take us. This book considers the social and ethical considerations of cloning, including whether cloning humans is acceptable, whether people are willing eat cloned food, and whether we should take advantage of medical therapies associated with cloning.
