Another way to classify bones is by which of the two skeletons of the body they belong to - axial, or appendicular. The axial skeleton forms the main frame of the body - the bones of the head and the trunk. In total, the bones of the axial skeleton include: Skull bones (frontal, occipital, sphenoid, ethmoid, 2 parietal, 2 temporal)

In short and irregular bones, spongy bone tissue is encircled by a thin layer of compact bone tissue. In flat bones, the spongy bone tissue is sandwiched between two layers of compact bone tissue. The spongy bone tissue is called the diploë. The periosteum covers the outside layer of compact bone tissue. The endosteum covers the trabeculae that fill the inside of the bone.

Bones consist of two types of osseous tissue; spongy bone and compact bone. These two bone tissue types work together in each bone and provide complementary functions. Compact bone is the hard outer portion of the bone, and spongy bone is the spongy, honeycomb-like bone tissue that is found at the ends of long bones and in the middle of your vertebrae.

The skeletal system consists of bones, cartilage, and the membranes that line the bones. Each bone is an organ that includes nervous tissue, epithelial tissue (within the blood vessels), and connective tissue (blood, bone, cartilage, adipose, and fibrous connective tissue). Bones have many functions, including the following:
