H71DOD - DILLON PERKINS

This first course in the physics curriculum introduces classical mechanics. Historically, a set of core concepts—space, time, mass, force, momentum, torque, and angular momentum—were introduced in classical mechanics in order to solve the most famous physics problem, the motion of the planets. The principles of mechanics successfully described many other phenomena encountered in the world.

The equations governing the individual particles are $p_1 = F(e)_1 + F_{21}$ $p_2 = F(e)_2 + F_{12}$ Assuming the equation of motion to be true, then $p_1 + p_2 = F(e)_1 + F_{21} + F(e)_2 + F_{12}$ must give $F_{12} + F_{21} = 0$ Thus $F_{12} = F_{21}$ and they are equal and opposite and satisfy the weak law of action and reaction.

Classical mechanics is a physical theory describing the motion of macroscopic objects, from projectiles to parts of machinery, and astronomical objects, such as spacecraft, planets, stars and galaxies. For objects governed by classical mechanics, if the present state is known, it is possible to predict how it will move in the future and how it has moved in the past. The earliest development of classical mechanics is often referred to as Newtonian mechanics. It consists of the physical concepts e

Two important theorems help us determine moments of inertia.

In classical mechanics, a harmonic oscillator is a system that, when displaced from its equilibrium position, experiences a restoring force F proportional to the displacement x : $F \rightarrow = -kx$ $\rightarrow, \{\displaystyle {\vec {F}}=-k{\vec {x}},\}$ where k is a positive constant. If F is the only force acting on the system, the system is called a simple harmonic oscillator, and it undergoes simple harmonic motion: sinusoidal oscillations about the equilibrium point, with a constant amplitude and a ...
