The Need-To-Know Guide On Conventional Fire Alarm Systems ...

What is a conventional fire alarm system
A conventional system employs one or more initiating circuits, connected to sensors (initiating devices) wired in parallel. These sensors are devised to decrease the circuits resistance when the environmental influence on any sensor exceeds a predetermined threshold.

Fire Alarm Conventional Systems Explained - Fire Systems ...

What is a Conventional Fire Alarm System? A conventional fire alarm is a safety system designed to detect and alert you to any signs of fire within your premises. How Does a Conventional Fire Alarm Work? Fire detection devices are individually connected to conventional fire alarm panels using wires.

Being responsible for a large property requires protecting your employees or tenants against the risk of fire. Fire alarm systems ensure that if a fire were to break out, you would be able to alert everyone with your addressable fire alarm or commercial fire alarm..

Commercial fire alarms are ideal for commercial properties looking to guard against fire risks.

Conventional Fire Alarm Systems Addressable Fire Alarm Systems Wireless Fire Alarm Systems Infrared/Ultraviolet Fire Alarm Servicing. Site Fire Alarms; Gas Detectors. ... A wide range of two and four wire conventional fire alarm panels and accessories to suit various commercial and domestic applications. View Products .

A conventional fire alarm system (sometimes referred to as a 4 wire system) consists of automatic detectors and manual call points wired to the fire alarm control panel in Zones. Each Zone is a physical wiring circuit. The fire alarm control panel has a number of Zone LEDs which will illuminate should a device in that zone be activated.

Apollo Orbis Detectors are ideal for use on conventional fire alarm systems. The Apollo Orbis Detector range includes various heat detectors, optical smoke detectors and multi criteria detectors.

A conventional fire alarm system normally consists of a control panel linked to a

number of lines of fire detectors and manual call points, normally called detection zones, and a number of sounder or alarm circuits. A simple system is shown in Figure 1. control panel. The control panel drives the detection zones and sounder circuits, provides LED indications of fire, fault or normal conditions and contains switches to allow the sounders to be activated or silenced and the detectors to reset ...

Conventional Fire Alarms panels

Conventional alarm panels cost a lot less to buy but are more expensive to install. This is because each device that is being connected needs its own wire. With addressable systems, one wire loop will connect several devices. This means conventional systems require more wire and more man hours during the installation phase. Additionally, addressable systems have a range of other facilities that can help save money.

The conventional fire alarm system is ideal for small shops and offices, schools, rented accommodation of all types, and more. The use of zones makes it easy to identify the location where the alarm was triggered. That means when the fire brigade turns up, they can go straight to the location of the suspected fire.

What's the Difference Between Conventional and Addressable ...

A conventional fire alarm system is often the natural choice for smaller systems or companies with budget restrictions. Within this system, the "intelligence" lies within the fire alarm control panel. The panel receives a trigger signal from a conventional detector or an initiating device. The designer must be sure that the last device on the circuit has sufficient voltage to operate the device within its rated voltage.
