Management of Leaf Blight Disease Caused by Alternaria ...

Tuberose Cultivation - A Beginners Guide | Agri Farming

Bacterial blight of anthuriums: Hawaii’s experience with a global disease.

Because little is known of tuberose, investigations were initiated at the Hawaii Agricultural Experiment Station to study the problems of the crop. Of the three serious diseases of tuberose found in Hawaii, two are caused by parasitic nematodes and one by a fungus. Of the two minor diseases, one is caused by an insect and bacterium and one by insects alone. 3

The tuberose is herbaceous, growing from underground tubers or tuberous roots. It produces offsets. The leaves are a dull green and about 1-1.5 ft (30-50 cm) long and up to 0.5 in (13 mm) wide at the base. They are slightly succulent. The inflorescence is a spike, reaching up to 3 ft (1 m) high, with pure white waxy flowers

DISEASES OF TUBEROSE IN HAWAII

Tuberose is an ornamental crop which is growing under tropical and sub-tropical areas. Recently, the incidence of leaf blight disease caused by Alternaria polianthi a fungal disease of tuberose is considered as a severe problem causing growth reduction and yield loss triggered by high temperature and humidity.

Foreigners brought diseases, such as the measles, influenza, introduced colds, viruses, and many other threatening diseases. These diseases killed about 75-80% of the pure Hawaiian population by 1819. Hawaiians had no immunity against the new diseases that the foreigners brought therefore, we have lost many of our pure Hawaiians.

Slugs and grass hoppers, which feed on the leaves, and thrips which damage and cause distortion of the spikes are the major pests. Malathion and carbaryl are effective against these pests. No major disease is noticed. Sclerotium fungus, which attacks the leaves and flower stalks at ground level causes defoliation and toppling of spikes.
