RHUOP9 - JAMIE LAWRENCE

This article reviews the fundamental solidification concepts for understanding microstructural evolution in fusion welds. The common concepts, namely, nucleation, competitive grain growth, constitutional supercooling, solute redistribution, and rapid solidification, depend on the solidification parameters during welding, are discussed.

In this paper the foundation is laid for a fundamental understanding of what happens during solidification. This knowledge is then used to derive practical con-

clusions about commercial casting alloys.

Solidification phenomena play an important role in many processes used in a wide range of fields, from production engineering to solid-state physics. Simple models have been developed to attempt to aid understanding of this complex subject.

The effects of local instabilities at the solid/liquid interface during growth are illustrated. The article also describes the solidification structures of pure metals, solid solutions, eutectics, peritectics, and monotectics.

Holland, 1982, p 15. ... Based on the difference in fusion entropy, the growth pattern of a crystal during solidification can be classified into faceted growth and non-faceted growth. In eutectic alloys, the eutectic morphology consists of regular eutectic and irregular eutectic in terms of the difference in the two phases participated [1].
