From the ancient Egyptian mummifications to 18th-century scientific research on "globules" and neurons, there is evidence of neuroscience practice throughout the early periods of history. The early civilizations lacked adequate means to obtain knowledge about the human brain. Their assumptions about the inner workings of the mind, therefore, were not accurate.

Thirty years ago, Victor Hamburger (1988) expounded the origins of the field of neural development, citing two streams, Histogenic Observation and Experimental Embryology. Of course there are no finer examples of the histogenetic approach to studying how neurons develop and connect with their targets than the studies of Ramon y Cajal (1911).
