Migrate large-scale monolithic applications to applications with a modular architecture; Articulate the advantages of modular software to your team . Java Application Architecture lays the foundation you'll need to incorporate modular design thinking into your development initiatives. Before it walks

you through eighteen patterns that will help you architect modular software, it lays a solid foundation that shows you why modularity is a critical weapon in your arsenal of design tools.

Both the MVC and MVVM design patterns separate front-end and back-end application components, but each one has unique methods of interface manipulation and abstraction. In the effort to create modular and reusable application code, two architecture design approaches

have dominated the intersection of back-end app components and the front-end user interface: the Model-View-Controller pattern and the Model-View-ViewModel pattern.

 Developing an android application by applying a software architecture pattern is always preferred by the developers. An architecture pattern gives modularity to the project files and assures that all the codes get covered in Unit testing. It makes the task easy for developers to maintain the software and to expand the features of the application in the future.

Java Application Architecture Modularity Patterns With Modularity involves breaking a large system into separate physical entities that ultimately makes the system easier to understand. By understanding the behaviors contained within a module and the dependencies that exist between modules, it's easier to identify and assess the ramification of change. For instance, software modules with few incoming dependencies are easier to change than software modules with many incoming dependencies.
