After a period of relative neglect in many countries, apprenticeships and other forms of work-based learning are experiencing a revival. Their effectiveness in easing school-to-work transitions and serving the economy is increasingly recognised. However, en-

gaging individuals, employers, social partners and education and training systems in such learning remains a significant challenge. In light of this, Seven Questions about Apprenticeships draws out policy messages on how to design and implement high-quality apprenticeships, using material from the OECD project Work-based Learning in Vocational Education and Training. It presents answers to seven questions commonly asked by governments and practitioners seeking to either introduce or reform apprenticeship systems for young people and/or older workers. Can apprenticeships provide a useful contribution in every country? Should employers receive financial incentives for providing apprenticeships? What is the right wage for apprentices, and how long should an apprenticeship last? How can we ensure a good learning experience at work? How can apprenticeships be made to work for youth at risk? And how to attract potential apprentices? The study establishes principles of effective practice by building on new analytical work and examples of effective practice from around the world.

Not everyone has a knack for Mathematics and several people simply give up when the teacher begins adding letters into the equations. However, there are actually some solid uses for Algebra 2 other than keeping headache medicine manufacturers in business. Building on the ideas and core concepts learned in basic

Algebra, the intermediate Algebra 2 introduces abstract thinking. Students learn how to identify likenesses and evaluate equations based on their characteristics. This information is useful for higher mathematical pursuits and is also helpful for general life. The analytic approach to problem solving is essential in both employment situations and personal relationships.

Since the creation of the National Cooperative Educational Statistics System in 1988, states have joined with the National Center for Education Statistics to produce and maintain comparable and uniform education statistics. Through the National Forum on Education Statistics, states have met to develop and propose a set of basic data elements for voluntary use. Using these data elements will provide more comparable and reliable education information for any educational system adopting the common terminology. The basic data elements will not meet every education information purpose, but a set of basic data elements should help answer the most frequently asked questions about the administration, status, quality, operation, and performance of schools and school systems. This report presents a process for selecting and including new data elements in an information system and the student and staff elements that can be used to create information for conducting the day-to-day administration of schools and school districts; completing federal and state reports, and creating indicators that address questions about the success and functioning of education systems. The basic data elements selected for student information systems are grouped into categories of: (1) personal information; (2) enrollment; (3) school participation and activities; (4) assessment; (5) transportation; (6) health conditions, special program participation, and student support services; and (7) discipline. Similar elements defined for staff information systems include personal information, educational background, qualification information, current employment, assignments, and information on career development and separation from employment. An appendix contains discussions of policy questions, indicators, and basic data elements. (SLD)
