The biochemical and genetic understanding of human disease has increased explosively in recent years. We now understand that most human disease is the result of interactions between genetic factors and environmental influences, and the combined influences are being identified in our society's most important and burdensome diseases, including cancer, diabetes, and degenerative disorders such as arthritis, Alzheimer's and Parkinson disease. When mutant genes combine with environmental factors to produce a cascade of malfunctions, treatment may take one of many different approaches. This book describes the range of disorders and the treatments which have become available for them as a result of our increased understanding. These treatments range from classical approaches such as the supply of a missing product of enzyme activity, through enzyme or cofactor replacement, to the exciting possibility of therapy directed specifically to the underlying defect, the mutant gene itself.

Linking existing knowledge to new knowledge by presenting it in the form of a case or a problem is a popular and effective educational approach resulting in better retention of the knowledge and improved ability to apply that knowledge to solve real problems. Cases were carefully selected to present a broad systems-based tour of commonly encountered clinical cases in pediatric anesthesia. The book can be used to review an upcoming clinical case or as a PBL tool. The 'Stem Case and Key Questions' and 'Discussion' sections can serve as the basis for interactive learning experiences for study groups or as a broad yet in-depth clinical review of the subspecialty for the individual learner.
