Many sedimentary structures originate by physical processes involving moving water or wind that operate at the time of deposition. Others are formed by physical processes such as gravity slumping or sediment loading that deform unconsolidated sediment after initial deposition (soft-sediment deformation).

Sandstones contain many kinds of sedimentary textures and structures that have potential environmental significance, as discussed in the preceding two chapters. Particle composition is also an important aspect of these rocks; it is a fundamental physical property of sandstones and is the chief property used in their classification.
