"A fascinating consequence of optical coherence, speckle has become one of the major optical phenomena. Most often, but not necessarily always, associated with laser illumination, it is relevant for the basic understanding of scattering phenomena and for application to high technology alike, from the Brownian motion to integrated circuit lithography and to the imaging of the sky by large telescopes.

Speckle pattern - Wikipedia

Abstract Light scattering due to interaction with a material has long been known to create speckle patterns. We have demonstrated that even though speckle patterns from different objects are very similar, they contain minute dissimilarities that can be used to differentiate between the originating scatterers.

When the speckle pattern changes in time, due to changes in the illuminated surface, the phenomenon is known as dynamic speckle, and it can be used to measure activity, by means of, for example, an optical flow sensor (optical computer mouse). In biological materials, the phenomenon is known as biospeckle.
